

The Norterra Organics processing facility converts green waste into high-grade compost used by commercial landscapers and home gardeners to enhance their soil and by engineers and contractors to control erosion.

High Grade Compost

Conserving and protecting our environment for today and tomorrow includes sustainable organic waste management that supports landfill diversion. Norterra Organics offers an alternative way to dispose of food scraps, food soiled paper, as well as plant and wood waste. The resulting high-grade compost and mulch created at the facility is used by engineers and contractors to control erosion, as well as commercial landscapers and gardeners to improve their soil quality.
